The fact that the heat transmission is proportional to the square of the difference of temperature of the two sides of the plate shows the importance of high furnace temperatures. The average values of the coefficient  $a$  obtained from Blechynden's experiments have been plotted in the adjoining diagram, Fig. 53, It will be seen that each plate has a law of rate of transmission of its own. Plates A and C have about the average values for the different thick  $t$  a Fig. 53.--Values  $Op$  a, Prom Blechynden's Experiments. nesses, and a line plotted from the formula  $a = 40 + 20 t$  is near to all the values obtained from plate A. The formula  $a = 40-f-201\ 10$  covers the whole range of the experiments. The very low values of  $a$  deduced from Blechynden's experiments, viz., 38.6 to 71.9, as compared with the values 200 to 400, commonly obtained in steam-boiler tests, are no doubt due to the exceptionally favorable conditions under which his experiments were made, all portions of the plate being clean and equally exposed to radiation and to contact with the hot gases, while in steam-boilers only a small fraction of the heating surface receives radiation from the incandescent fuel or from glowing fire-brick, the surface is apt to be more or less covered with soot, dust, scale, or grease, and the...
